## III. AMENDMENTS TO THE SPECIFICATION

On Page 6, Paragraph 1:

As shown in FIG. 2, a drip pan 60 is disposed immediately below the basin 50 for collecting the liquid dripping and/or overflowing from the basin 50. The drip pan **60** has a top opening which communicates with a drain port **52** at the bottom center of the basin 50, and also with an overflow duct 34 leading to an upper edge of the basin 50. The drip pan 60 has a filter 63 for entrapping contaminants dislodged from the shaver head 12 and carried on the liquid dribbling through the drain port 52 into the drip pan 60. The liquid thus cleared of the contaminants is fed through a connection port 65 to a fluid intake channel 22 leading to the tank 100. The pump 70 is disposed in the fluid intake channel 22 for drawing the liquid from the basin 50. The fluid intake channel 22 is open to the atmosphere through the drain port 52, the overflow duct 34, and also through an air vent 36 formed in the base 30 around the basin 50. Thus, depending upon the level of the liquid in the basin 50, the outside air is drawn alone or together with the liquid by the action of the pump 70 into the tank 100 through the fluid intake channel 22. The tank 100 is provided in the form of a hermetically sealed container having an inlet and an outlet. The inlet is defined by a fluid inlet tube 102 which is detachably connected to the fluid intake channel 22 for taking in the liquid and/or the air. The outlet is defined by a liquid outlet tube 104 which is detachably connected to a liquid supply channel 24 formed in the housing 20 and leading to a spout 25 upwardly of the basin 50, as best shown in FIG. 9, for flowing the liquid down into the basin 50. Turning back to FIG. 2, the liquid outlet tube 104 is connected to a U-shaped sucking tube 105 which extends deep into the tank **100** to a point adjacent to the bottom of the tank for sucking the liquid. Further, the tank 100 is formed with an air exhaust tube 106 detachably connected to an air exhaust channel 26 which extends within the housing 20 and is open to the atmosphere through ventilation windows 28-29 or clearances in the walls of the housing 20. An air valve 80 is disposed in the air exhaust channel 26 to selectively

close the tank and open it to the atmosphere. The air valve **80** is realized by a normally-closed electromagnetic valve which opens upon being energized or supplied with an electric current. A cap **112** is detachably and sealingly mounted in a filling port **110** in the upper end of the tank **100** for replacing or replenishing the liquid.
